

New Cable Coiling Technology Features

Hardware & Software Optimizations

The newer technology of the REELEX machine features the latest optimizations in both hardware software, and has been customized for many manufacturers products, making this premium wire and cable brand's Big Mouth Payout bulk wire dispenser even better.

REELEX's tangle-free technology is a patented method of winding wire and cable into a figure-eight coil. In optimizing each coil, factors such as gain, payout hole control and the density of the wind, along with progressive coil tension, are all instrumental to producing tangle-free packages. This coil can only be produced on a specially designed and patented REELEX machine with customized software.

The REELEX II coil in the bulk wire carton does not rotate during payout and there is no inertia. Void of any moving parts, the coil dispenses from the inside-out with a clear path and avoids twist, tangles and snags that plague bulk wire cartons.

The REELEX II technology is a key element in ICE Cable System Big Mouth Payout bulk wire cartons, that along with other conveniences such as ascending and descending foot markers on the cable jackets and extremely durable 24kg burst-tested cardboard with dual-layer handles, have made it very popular among installers.

Installers need to know there is knock-off, pull-box packaging out there. Non-REELEX coils might look and act like REELEX, but are prone to tangling, cable deformities and prone to tangling, cable deformities and can cause damage to the cable leading to performance issues.
